

TTS REPORTS V1.0

Implementation, Access, Risk and Operating Plan

Prepared for internal review - Test and Tag Supplies

Based on TTS Reports V1.0 Stable Build - Version Label

Recommended Position

Launch TTS Reports V1.0 as a free, customer-support reporting aid for eligible Test and Tag Supplies customers. Keep the first release controlled, require users to review all output before issuing reports, and use the pilot to validate whether a future paid product is justified.

1. Executive Summary

TTS Reports V1.0 is a browser-based reporting aid designed to help eligible Test and Tag Supplies customers generate cleaner PDF reports from supported exported Metrel test data. The app is intended to reduce support friction, improve customer experience, strengthen the Test and Tag Supplies brand, and create a practical pathway toward a future paid reporting platform.

The app should be positioned carefully. It should not be marketed as official Metrel software, a compliance certification engine, or a replacement for technician review. It should be described as a reporting aid that processes user-supplied exported data and helps users generate clearer documents from that data.

Core Recommendation

Treat V1.0 as a controlled customer-support release. Offer it free to eligible existing customers, run a short pilot, document all bugs and feature requests, and only consider broader access or paid licensing after report accuracy and customer demand have been validated.

2. Decision Summary

Decision Area	Recommended Position
Primary objective	Reduce reporting-related support load and improve the customer experience.
Target users	Existing Test and Tag Supplies customers using supported Metrel export workflows.
Access model	Controlled access first: internal staff, pilot customers, then eligible customers.
Pricing	Free for eligible customers during MVP/pilot; reserve advanced workflow features for future paid versions.
Branding	TTS Reports by Test and Tag Supplies. Avoid implying official Metrel endorsement unless formally agreed.
Data handling	No permanent storage of customer files or generated reports. Temporary processing only.
Legal posture	Require Terms of Use, report disclaimer, and user verification before issuing reports.
Support posture	Best-efforts support for V1.0 with critical report accuracy issues prioritised.
Pilot	5-10 trusted users over 4-6 weeks before wider rollout.

3. Product Purpose and Objectives

The app exists because customers commonly experience difficulty creating clear, useful customer reports from existing test and tag software workflows. TTS Reports provides a simpler layer between exported project data and a professional PDF output.

Objective	Purpose	Priority
Reduce support calls	Give customers a simpler reporting workflow so staff spend less time troubleshooting report generation.	High
Improve customer experience	Make report creation less frustrating for contractors and compliance users.	High
Boost brand reputation	Position Test and Tag Supplies as a practical solutions provider, not only an equipment supplier.	High

Create competitor advantage	Offer a value-added tool competitors may not provide.	Medium
Validate paid product demand	Use the MVP to test whether customers would pay for cloud storage, saved projects, user accounts, or advanced reporting.	Medium

Recommended Objective Statement

TTS Reports V1.0 is being launched as a customer-support and brand-value tool that helps eligible Test and Tag Supplies customers generate cleaner reports from supported exported test data, while reducing support friction and validating demand for future reporting products.

4. Customer Eligibility and Access Policy

The safest initial release model is controlled access. The app should be offered first to internal users and trusted existing customers, then expanded to eligible customers once the pilot confirms the workflow is reliable.

Access Group	Eligibility	Purpose
Internal users	Test and Tag Supplies staff only.	Testing, demonstrations, customer support.
Pilot users	Selected trusted existing customers using supported workflows.	Real-world validation and feedback.
Eligible customers	Existing TTS customers with compatible Metrel equipment or export files.	Primary V1.0 user group.
Public users	Not recommended for the initial release except possibly a sample-data demo.	Lead generation only if risk is controlled.

4.1 Non-customer Access Policy

- Do not provide unrestricted access to non-customers during V1.0.
- Do not offer support for unsupported equipment, unsupported file formats, or custom report workflows outside the MVP scope.
- Do not provide the tool to competitors, resellers, or parties likely to copy the product positioning or workflow.
- Require acceptance of Terms of Use before report generation.

5. Pricing and Licensing Model

The recommended V1.0 model is free access for eligible customers during the MVP and pilot period. This supports the main objective: support reduction and customer goodwill. It also avoids prematurely creating paid-service obligations before the app has been validated across real customer files.

Stage	Model	Reason
Internal test	Free/internal only	Confirm workflow and report accuracy before customers use it.
Pilot	Free to selected customers	Collect feedback and identify bugs using real files.
V1 customer release	Free for eligible existing customers	Customer support, brand reputation, and retention value.
Future Pro	Paid subscription, licence, or equipment bundle	Monetise advanced features once validated.

5.1 Future Paid Product Boundary

Keep V1.0 useful but deliberately limited. Reserve advanced workflow features for a future paid product.

- Future paid features could include cloud storage, saved projects, customer database, report history, batch reporting, email sending, advanced branding, technician logins, scheduled retest reminders, and multi-user access.
- Avoid promising these features in V1.0 customer communication. Describe them as possible future improvements only.

6. Customer Communication Plan

Communication should be helpful and controlled. The message should emphasise customer support and clarity, while avoiding claims that the tool certifies compliance or replaces user review.

Channel	Use
Email to eligible customers	Primary announcement and pilot invitation.
Website support page	Home for user guide, terms, known issues, and update notes.
Support calls	Staff can recommend the tool to customers struggling with report generation.
Product pages	Mention as a value-add for compatible workflows only after pilot validation.
Short help video	Show export, upload, preview, and download workflow.

Suggested Customer Message

We have developed TTS Reports V1.0 to help eligible Test and Tag Supplies customers generate cleaner PDF reports from supported exported test data. The tool can import supported files, display asset data, preview reports, and generate Basic, Pro, and Upcoming Retest reports. Reports must always be reviewed by the user before being issued.

7. Supplier and Partner Conflict Review

TTS Reports should be framed as a customer-support layer, not a replacement for supplier software. This reduces the chance of supplier conflict while still solving the customer problem.

Risk	Recommended Control
Perceived criticism of Metrel reporting software	Use neutral language: customer reporting aid, supported exported data, cleaner reporting workflow.
Trademark or endorsement confusion	Do not use supplier logos without permission. State that third-party names are used only to identify compatibility.
Proprietary format sensitivity	Prefer user-exported files and avoid public claims of reverse engineering. Seek legal review if expanding format support.
Report output discrepancy	Require user review and maintain a critical bug process for report accuracy issues.

8. Support Responsibility and Operating Model

A free support tool still creates reputational expectations. The support obligation should be defined before release so customers understand what is and is not included.

Area	V1.0 Position
Support basis	Best-efforts support.
Guaranteed uptime	No formal uptime guarantee for free MVP.

Report accuracy issues	Critical priority if pass/fail status, missing assets, dates, or customer details are affected.
Custom features	Recorded as feature requests; not promised.
Unsupported files	Declined or logged for future review.

The ACCC notes that service providers must carry out services with an acceptable level of care and skill and take reasonable steps to avoid loss or damage. This supports the recommendation to use careful claims, disclaimers, and a controlled rollout rather than over-promising what V1.0 can do.

9. Bug Reporting Process

All bug reports should be captured in a central register. Any bug involving report data integrity should be treated as critical.

Field	Required Detail
Customer details	Business name, contact person, phone/email.
Environment	Browser, device, operating system, mobile/tablet/desktop.
Source workflow	aPAT, PATLink PC, ES Manager, exported PDF, APX, PADFX, XLSX, or other.
File type	Exact uploaded file type and export source.
Issue summary	What happened and what was expected.
Evidence	Screenshot, source file if customer consents, generated report, date/time.
Severity	Critical, High, Medium, Low.
Decision	Fix now, defer, reject, investigate, awaiting sample file.

Severity	Definition	Action
Critical	Incorrect pass/fail status, missing assets, wrong dates, wrong customer/site data.	Immediate review; pause promotion if necessary.
High	Report renders but important fields are incorrect or incomplete.	Prioritise next maintenance release.
Medium	Formatting issue, unclear wording, minor missing field.	Add to backlog.
Low	Cosmetic issue or preference.	Review during UI polish cycle.

10. Feature Request Process

Feature requests should be recorded but not promised. The goal is to identify repeated customer demand and separate support-reduction features from future paid product features.

Scoring Factor	Score 1-5
Customer value	How much does it help real users?
Support reduction	Will it reduce calls or confusion?
Revenue potential	Could this become a paid feature?
Build complexity	How much effort is required?
Risk	Could it increase legal, privacy, supplier, or report accuracy risk?
Strategic fit	Does it align with the product direction?

Requests should be reviewed monthly during pilot and quarterly once stable. Features that affect report accuracy, file parsing, compliance wording, or data handling require management approval before implementation.

11. Branding and Product Identity

TTS Reports should be presented as a Test and Tag Supplies product, with careful compatibility wording. The product should look like a practical, professional support tool: clean, industrial, trustworthy, and aligned with the existing TTS brand palette.

- Preferred name: TTS Reports by Test and Tag Supplies.
- Use TTS red, seafoam/teal, charcoal, beige, and white branding.
- Keep the V1.0 label visible in the footer and release notes.
- Avoid using third-party logos unless permission is granted.
- Include short disclaimer text in the app and generated reports.

12. Version Control, Updates and Change Management

Every release should be versioned, archived, tested, and accompanied by release notes. Stable builds should never be overwritten without keeping a copy of the previous version.

Version Type	Meaning	Example
Major	Large change to product model or architecture.	V2.0.0 - user accounts/cloud storage.
Minor	New feature that does not break existing workflow.	V1.1.0 - new report filter.
Patch	Bug fix or small adjustment.	V1.0.1 - PDF preview fix.

Update Type	Notification Method
Critical bug fix	Email affected/pilot users and add app notice.
Report accuracy change	Email users if known; update changelog and known issues.
Minor UI change	In-app changelog.
New feature	Newsletter, support page, and in-app release notes.
Downtime or retirement	Website notice and direct email where practical.

13. Maintenance Resource Requirements

The app should have named internal ownership before customer release. Without ownership, a useful free tool can become a support burden.

Role	Responsibility
Product owner	Prioritises features, approves release scope, owns customer positioning.
Technical maintainer	Fixes bugs, manages deployment, maintains dependencies and hosting.
Support contact	Receives bug reports and customer feedback.
Management approver	Approves pricing, public release, legal posture, and supplier communications.

For pilot, allow approximately 1-2 hours per week for feedback review and 2-5 hours per month for minor fixes. Public access may require more support time depending on adoption and file variation.

14. Hosting, Security and Cybersecurity Requirements

Because users upload files that may contain customer names, site information, asset registers, technician details, and test results, the hosted version should use HTTPS and basic file-processing security controls from the beginning.

Requirement	Recommended Control
Hosting	Python-compatible hosting on a controlled subdomain such as reports.testandtagsupplies.com.au.
HTTPS/SSL	Mandatory for all hosted access. HTTPS encrypts browser-to-server traffic.
File uploads	Restrict allowed file types and apply file size limits.
Temporary storage	Store uploads outside public web root and delete after processing.
Server access	Restrict admin access; use strong credentials and MFA where available.
Abuse protection	Add rate limits, upload limits, and monitoring.
Dependencies	Review and update Python/package dependencies periodically.
Backups	Back up app code and configuration; customer uploaded data should not be retained.

15. Data Privacy, Retention and Confidentiality

TTS Reports should be designed and communicated as a no-permanent-storage tool. Uploaded files are processed for the purpose of generating a report and should not be retained unless the customer separately provides a file for troubleshooting.

The OAIC states that most small businesses are not covered by the Privacy Act, but some are, and covered businesses must comply with the Australian Privacy Principles. The OAIC also recommends good privacy practice even where the Privacy Act does not apply. This supports a privacy-by-design approach for TTS Reports.

Data Type	Recommended Handling
Uploaded project files	Temporary processing only; delete immediately or within 24 hours.
Generated PDF reports	Temporary processing only; delete within 24 hours.
Support-submitted files	Retain only with customer consent; delete after issue closure or within 30-90 days.
Technical logs	Avoid storing customer data in logs. Retain only necessary operational information.
Development test data	Use anonymised or sample data wherever possible.

Suggested Privacy Statement

TTS Reports processes uploaded files only for the purpose of generating reports. Test and Tag Supplies does not intentionally retain uploaded project files or generated reports after processing, unless the customer separately provides files for support or troubleshooting.

16. Legal Liability and Report Accuracy Risk

The most important risk is an incorrectly rendered report: for example, a failed item shown as passed, a missing asset, incorrect retest date, or incomplete site/customer information. This risk must be controlled through product design, disclaimers, testing, and customer communication.

Risk Scenario	Control
Incorrect pass/fail status	Treat as critical bug; test against known sample files; require preview and user review.
Missing assets	Show imported data table and report preview before export.
Incorrect dates	Use clear date parsing rules and include source metadata where possible.
Unsupported file variation	Display clear error and request sample file; do not guess silently.
Customer relies on report without checking	Require terms acceptance and include report disclaimer.

Recommended Report Disclaimer

This report was generated from imported test data supplied by the user. The user is responsible for verifying all asset details, test results, pass/fail statuses, retest dates, and customer information before issuing this report. TTS Reports is a reporting aid and does not independently verify the accuracy, completeness, legality, or compliance status of the underlying test data.

17. Terms of Use and Acceptable Use Policy

Terms should be accessible from the app footer, help page, website support page, and before first report generation. Users should accept them before generating reports.

Terms Section	What It Should Cover
Eligibility	Who may use TTS Reports and when access may be refused or withdrawn.
Supported use	Supported file types and intended reporting-aid purpose.
User responsibility	User must verify all reports before issuing them.
No certification	The app is not a compliance certification service.
Data handling	Temporary processing and no permanent storage position.
Availability	Best-efforts operation; no guaranteed uptime for free MVP.
Liability limitation	Appropriate limits subject to legal review and Australian Consumer Law.
Acceptable use	No abuse, automated bulk uploads, malicious files, resale, or unauthorised access.
IP ownership	TTS owns app, interface, templates, code, and documentation; users own their uploaded data.
Governing law	Queensland/Australia, subject to legal review.

18. Intellectual Property and Copyright Considerations

The app, interface, report templates, documentation, branding, and source code should be documented as Test and Tag Supplies intellectual property unless a separate development agreement states otherwise. Customers retain ownership of their uploaded data and generated business records.

- Do not use supplier logos, screenshots, or exact report layouts without permission.
- Use third-party product names only for compatibility identification.
- Do not claim official supplier endorsement unless formally agreed.
- Avoid copying supplier manual wording into documentation.
- Ensure any icons, fonts, or UI assets used in the app are properly licensed.
- If outside developers assist, ensure written assignment of IP rights to Test and Tag Supplies.

19. Downtime, Retirement and Service Continuity

Because V1.0 is recommended as a free support tool, do not promise continuous availability. However, outages and retirement should still be communicated professionally.

Event	Recommended Communication
Short outage	App notice if practical.
Extended outage	Website/support page notice and email to pilot users if necessary.
Critical bug discovered	Disable affected workflow if necessary; notify affected users if known.
Planned maintenance	In-app notice and support page update.
Product retirement	30 days notice where practical for free customer tool; shorter notice may apply for pilot.

Because TTS Reports should not permanently store customer data, retirement risk is reduced. Customers must still be reminded to keep their own source files and generated reports.

20. Training, User Guide and Support Materials

Training should focus on simple, practical usage rather than technical detail. The minimum requirement is a one-page guide, in-app help, and a short video showing the export-upload-preview-download workflow.

Material	Purpose	Owner
Quick-start guide	Fast instructions for customers.	Product owner/support team.
Full user guide	Detailed workflow, supported file types, troubleshooting.	Product owner with technical review.
Short video	Shows actual usage flow.	Support/marketing.
Known issues page	Communicates limitations and current bugs.	Product owner/technical maintainer.
Before issuing checklist	Reminds users to verify report data.	Support/product owner.

21. Browser, Tablet and Mobile Compatibility

The strategic advantage of TTS Reports is that customers may export project data from the aPAT application on a tablet and then generate a report without needing a Windows PC. However, the primary supported workflows should still be desktop, laptop, and tablet rather than small mobile phones.

Platform	Support Position
Desktop/laptop	Primary supported workflow.
Tablet	Supported and strategically important for aPAT users.
Mobile phone	Limited support due to screen size and file handling.
Chrome/Edge/Safari/Firefox latest	Recommended supported browsers.
Internet Explorer/old browsers	Not supported.

22. Pilot Program and Beta Framework

A controlled pilot is recommended before wider release. The pilot should confirm that the app works with real exported files, reduces support pressure, and does not create unacceptable accuracy or legal risk.

Pilot Element	Recommendation
Pilot group	5-10 trusted existing customers plus internal staff.
Duration	4-6 weeks.

Customer mix	Include aPAT users, ES Manager users, and customers who previously needed reporting support.
Feedback method	Short structured form plus support call notes.
Success threshold	80%+ can generate a report without support and no unresolved critical data-integrity bugs.

22.1 Pilot Feedback Questions

- Could you upload your file successfully?
- Did the imported asset data look correct?
- Did the Basic Report and Pro Report render correctly?
- Were pass/fail statuses, dates, and customer details correct?
- Were any assets missing from the report?
- Was the report acceptable to send to your customer after review?
- What confused you during the workflow?
- What feature would you most want next?
- Would you pay for a more advanced version with saved projects or cloud storage?

23. Implementation Roadmap

Phase	Action	Outcome
Phase 1 - Internal readiness	Finalise Terms of Use draft, report disclaimer, version control, bug register, and known issues page.	Controlled release foundation.
Phase 2 - Security and hosting	Deploy to HTTPS subdomain with upload limits and temporary file deletion.	Safer hosted pilot.
Phase 3 - Pilot	Invite 5-10 trusted customers and collect structured feedback.	Real-world validation.
Phase 4 - Fix and stabilise	Resolve critical bugs and update user guide.	Release candidate.
Phase 5 - Customer release	Offer to eligible existing customers with clear terms and support boundaries.	Support reduction and brand value.
Phase 6 - Product review	Assess demand, support load, feature requests, and paid product viability.	Decision on future Pro version.

24. Governance Checklist Before Release

Checklist Item	Status to Confirm
Objective agreed	Support reduction / customer value / brand reputation.
Eligibility criteria approved	Existing eligible TTS customers first.
Terms of Use drafted	Legal review recommended.
Report disclaimer added	Visible in app and generated reports.
Privacy statement drafted	No permanent storage clearly explained.
Bug register created	Critical report-accuracy category included.
Feature register created	Scoring and review process defined.
Version control process active	Stable builds archived and changelog maintained.
Hosting secured	HTTPS, upload limits, temporary file deletion.
Pilot users selected	5-10 trusted users.
User guide drafted	Help page and PDF/website guide ready.

Supplier-risk language checked	No official endorsement or replacement claims.
--------------------------------	--

25. Development Log

This development log summarises the stable V1.0 feature direction and operating controls recommended for release. It can be extended as code releases are made.

Version / Stage	Change or Decision	Notes
V1.0 Stable Build	Multi-format import, Asset Register dashboard, report preview, Basic/Pro report generation, Upcoming Retest reporting, settings, and version footer.	Current stable baseline.
Planning Review	Defined objective, access policy, pricing model, risk controls, and pilot structure.	This report.
Pre-pilot	Add/confirm Terms of Use, report disclaimer, privacy statement, bug register, and feature request register.	Required before customer pilot.
Pilot Release	Controlled release to selected customers.	Collect feedback and report rendering evidence.
V1.0.1 candidate	Patch critical bugs found during pilot.	Release only after sample-file regression testing.
V1.1 candidate	Consider minor features requested by multiple pilot customers.	Do not add cloud/user accounts unless moving toward paid product.

26. Final Recommendation

Recommended Launch Position

TTS Reports V1.0 should be launched as a free, controlled, customer-support reporting aid for eligible Test and Tag Supplies customers. It should not be positioned as official supplier software, compliance certification software, or a replacement for technician review. The business should run a pilot, record bugs and feature requests, protect customer data through temporary processing only, and use the release to validate whether a future paid Pro version is viable.

The app has a strong strategic fit if managed carefully. It can reduce support pressure, make customers more successful with their existing equipment, and strengthen Test and Tag Supplies as a practical problem-solver. The key is to control access, control claims, control data handling, and control version changes.

Appendix A - Source and Legal Review Notes

This document is an internal planning report, not legal advice. Terms of Use, liability limitations, privacy wording, supplier compatibility language, and consumer-law exposure should be reviewed by management and, where appropriate, a qualified solicitor before public release.
