

TTS REPORTS

V1.0 Scope Control and Future Build Roadmap

Project creep guardrails for the stable reporting MVP

Core Scope Rule

TTS Reports V1.0 Stable is the locked baseline. Future V1.0.x work may make the app more reliable, safer, clearer, and easier to support - but not bigger.

Prepared for internal planning, pilot control, product governance, and staged development decision-making.

Document status: Draft for review

Baseline build: TTS Reports V1.0 Stable Build - Version Label

Recommended use: Keep this document beside the development backlog and use it to decide whether a feature belongs now, later, or never.

1. Executive Summary

This document defines a clear scope boundary for TTS Reports following the V1.0 Stable release. Its purpose is to prevent project creep by separating the current stable product from future product ideas.

The recommended approach is to treat V1.0 as a locked reporting aid, not an expandable business platform. V1.x should focus on reliability, report accuracy, customer guidance, documentation, pilot readiness, and controlled customer release. Account-based, paid, cloud, automation, billing, customer database, and advanced workflow features should be reserved for V2.0 or later.

Best Scope Statement

TTS Reports V1.x is a reporting aid, not a reporting platform. It helps customers import supported data, review it, preview reports, and export cleaner PDFs. Anything involving accounts, storage, automation, billing, or business workflow belongs to V2.0 or later.

2. Product Definition

2.1 What TTS Reports Is

TTS Reports is a web-based reporting tool that helps Test and Tag Supplies customers generate cleaner PDF reports from exported Metrel test data.

- Import supported exported files.
- Display imported asset and test data.
- Generate clean PDF reports.
- Reduce customer frustration with existing reporting software.
- Reduce support calls.
- Improve Test and Tag Supplies brand value.

2.2 What TTS Reports Is Not

TTS Reports should not drift into a broad business-management platform. It is not:

- A full replacement for Metrel software.
- A certified compliance system.
- A customer database or cloud storage platform.
- A CRM, job scheduler, invoicing system, or technician management system.
- A general test-and-tag business operating system.
- A place to permanently store customer records.

3. V1.0 Stable - Locked Scope

Version name: TTS Reports V1.0 Stable

Primary objective: Allow eligible customers to import supported test data and generate clean, usable PDF reports.

Scope Area	Included in V1.0 Stable
Import	Import supported exported file formats; parse imported test data; display imported data in the app.
Asset Register Dashboard	Display imported assets; review asset/test result data; group assets by location using tree view; expand all/collapse all.

Scope Area	Included in V1.0 Stable
Reports	Generate Basic Report, Pro Report, and Upcoming Retest Report; preview before export; export as PDF; include improved title page/branding.
Settings	Business profile details; branding/report details; report defaults; local browser-based settings storage.
Interface	Dashboard-style app interface with import, asset register, reports, settings, help/documentation, and footer version label.
Documentation	README, running instructions, project scope document, implementation/risk plan, development log/changelog/revision history.

4. V1.0 Hard Boundaries

The following features are not allowed in V1.0 unless required to fix a serious data integrity or report generation bug.

Do Not Add to V1.0
User accounts, login system, cloud storage, saved projects, or customer database.
Technician database, job scheduling, invoicing, email sending, SMS reminders, or payment/subscription billing.
Admin dashboard, multi-business tenancy, API integrations, mobile app, offline installer, or automatic tester syncing.
AI report analysis, compliance certification logic, advanced analytics, full asset lifecycle management, customer portal, or white-label reseller system.

V1.0 Rule

V1.0 is allowed to become more reliable, but not bigger.

5. V1.0.x Maintenance Scope

V1.0.x builds exist only to stabilise the current product. They should not expand the product category or introduce major new workflows.

Version Type	Allowed Work
V1.0.1	Fix PDF save/export bug, import error, or report rendering issue.
V1.0.2	Fix parser issue for supported file type or correct missing field handling.
V1.0.3	Fix report formatting, pagination, layout, or title page issue.
V1.0.4	Improve error messages, browser compatibility, or console errors.
V1.0.5	Update README, help text, changelog, or minor wording.

5.1 Allowed V1.0.x Changes

- Bug fixes.
- File import reliability fixes.
- Report rendering and PDF generation fixes.

- Incorrect or missing field corrections.
- Console error fixes.
- Browser compatibility fixes.
- Minor layout fixes.
- Help text and changelog updates.
- Security/configuration fixes.

5.2 Not Allowed in V1.0.x

- Any new major feature.
- Any new business workflow.
- Any feature requiring user accounts.
- Any feature permanently storing customer data.
- Any feature changing the purpose of the app.

6. Future Build Scope

Build	Name	Primary Objective	Main Focus
V1.1	Pilot Release	Make the stable build safe, understandable, and usable by selected pilot customers.	Guidance, terms, privacy, disclaimers, error handling, feedback process.
V1.2	Report Quality Release	Improve report accuracy, layout, formatting, and supported data handling based on real pilot feedback.	Report layout, parser reliability, date handling, retest logic, regression testing.
V1.3	Controlled Customer Release	Release to a wider group of eligible customers with controlled access and support processes.	Access process, customer communication, support workflow, changelog, final branding.
V2.0	Pro Platform	Decide whether TTS Reports should become a paid/account-based product.	Accounts, saved projects, cloud storage, report history, advanced reporting, subscriptions.
V3.0	Reporting Platform	Become a full web-based test and tag reporting ecosystem if validated by demand and revenue.	Teams, portals, automation, integrations, advanced permissions, analytics.

7. V1.1 - Pilot Release Scope

Primary objective: Make the stable build safe, understandable, and usable by selected pilot customers.

Allowed Area	Allowed Features
User Guidance	Better onboarding screen; how-to walkthrough; supported file types explanation; before-export and before-issue checklists.
Error Handling	Better import failure messages; unsupported file message; no-data-found message; file parsing guidance.
Pilot Feedback	Feedback form link; bug report link; feature request link; clear version/build number.

Allowed Area	Allowed Features
Legal/Safety	Terms of Use page; privacy/data handling page; report disclaimer; user confirmation before generating reports.
Documentation	User guide PDF; internal support guide; known issues page; pilot feedback register.

V1.1 exclusions: no user accounts, cloud storage, subscription billing, customer database, automated emails, job management, or admin portal.

Success criteria: selected users can import files without handholding; reports are generated correctly; support team understands the workflow; bugs and feature requests are captured; no unresolved critical report accuracy issues remain.

8. V1.2 - Report Quality Release Scope

Primary objective: Improve report accuracy, layout, formatting, and supported data handling based on real pilot feedback.

Allowed Area	Allowed Features
Report Improvements	Better Basic Report, Pro Report, title page, summary sections, failed items summary, retest layout, pagination, table formatting, and long asset name handling.
Data Handling	Improved parser reliability, date handling, duplicate/latest-test handling, retest calculations, and pass/fail consistency checks.
Quality Assurance	Internal test file library; sample regression files; release checklist before publishing a new build.

V1.2 exclusions: customer storage, saved report history, accounts, automated reminders, and dashboard analytics.

9. V1.3 - Controlled Customer Release Scope

Primary objective: Release TTS Reports to a wider group of eligible customers with controlled access and support processes.

Allowed Area	Allowed Features
Access Control	Password-protected access page if required; customer-only access instructions; eligibility wording; internal process for sharing the access link.
Support Workflow	Formal bug reporting process; feature request process; support email link; internal triage template; known issues list.
Communication	Customer announcement page; quick-start video or guide; update/changelog page; downloadable user guide.
App Polish	Final branding pass; footer links for Terms, Privacy/Data Handling, Help, Version History, and Contact Support.

V1.3 exclusions: paid subscriptions, customer login accounts, project history, stored files, and advanced business workflows.

10. V2.0 - Pro Platform Decision Point

V2.0 should only begin if V1 proves genuine demand. It is the point where TTS Reports may move from free support tool to paid, account-based product.

10.1 Entry Requirements Before V2.0

- Customers are actively using V1.
- Users request ongoing access.
- Users ask for saved projects or report history.
- Support load has reduced or customer satisfaction has improved.
- At least some users say they would pay.
- Report accuracy issues are under control.
- Management approves commercialisation.

10.2 Possible V2.0 Features

Category	Possible Features
Accounts and Storage	User accounts, business profiles, saved projects, saved report history, customer records, cloud storage, previous report downloads.
Advanced Reporting	Custom report templates, more branding options, batch report generation, customer-specific layouts, technician signatures, compliance register exports.
Business Workflow	Retest reminder dashboard, customer asset history, scheduled retest lists, email report to customer, CSV/XLSX export, multi-technician support.
Commercial Features	Subscription billing, licence management, free/basic/pro tiers, usage limits, trial period, customer admin panel.

11. V3.0 - Full Reporting Ecosystem

V3.0 is not part of the current project. It is a future business decision only if V2.0 proves revenue potential.

- Multi-business tenancy.
- Staff/team accounts.
- Customer portals.
- Scheduled report delivery.
- Asset history over time.
- Retest campaign management.
- Advanced analytics.
- Integrations with store/customer records and product consumables.
- White-label reports.
- API integrations.
- Advanced permission controls.
- Subscription tiers.
- Admin dashboard.
- Usage analytics.
- Audit trail.

12. Feature Parking Lot

The parking lot protects the current build from unfocused expansion. Parking a feature is not rejecting it; it means assigning it to a later decision point.

Parked Features
User accounts, cloud storage, customer database, report history, technician database.
Email reports, SMS reminders, AI report checker, mobile app, subscription billing, admin dashboard.
Customer portal, white-label version, multi-business version, automatic retest reminder emails.
Job scheduler, invoicing, quote generation, inventory/consumables tracking.
Direct tester integration, API access, Shopify customer integration, Metrel cloud sync if ever available.
Team permissions, digital signatures, client acceptance signatures, compliance certificate generator, QR code asset labels.

13. Decision Filter for New Features

Before adding any feature, answer these questions. If the feature fails the current version objective, it should be parked.

1. Does this directly improve importing data?
2. Does this directly improve report accuracy?
3. Does this directly reduce support calls?
4. Does this directly help users generate a report?
5. Is this needed for pilot/customer release?
6. Can this be built without adding accounts or storage?
7. Can this be supported by the current team?
8. Does this increase legal or compliance risk?
9. Does this belong in a later paid version?
10. Will this delay release?

Decision Rule

Add the feature now only if it supports the current version objective, does not expand the product category, does not create major new support obligations, and does not belong in a future paid version. Otherwise: park it.

14. Scope Creep Warning Signs

These phrases usually mean the project is drifting away from the current build scope:

- While we are here, can we also add...
- This would be easy to include.
- Customers might want this one day.
- It is basically the same as the current feature.
- Let us just add a simple login.
- Let us save the customer details for later.
- Let us send the report by email.
- Let us make it work for every tester brand.
- Let us turn it into a full dashboard.
- Let us add admin tools.

- Let us make it subscription-ready now.

Counter-Rule

Every time one of these appears, ask: Does this belong in the current build, or is it a future version feature?

15. Recommended Version Roadmap

Build	Status / Purpose	Do This	Do Not Do This
V1.0 Stable	Locked baseline. Working app that imports supported files and generates reports.	Maintain, fix, document.	Do not expand.
V1.1 Pilot	Make it safe and clear for selected customers.	Terms, privacy, help, feedback, disclaimers.	No major features.
V1.2 Report Quality	Improve output quality based on pilot use.	Formatting, parser consistency, report accuracy, regression testing.	No accounts/storage.
V1.3 Customer Release	Controlled wider rollout.	Access process, communication, support process, update process.	No billing/platform shift.
V2.0 Pro Platform	Paid/cloud/account-based product if validated.	Accounts, saved projects, subscriptions, advanced reporting.	Do not start without evidence.
V3.0 Ecosystem	Full SaaS platform if revenue justifies it.	Teams, portals, automation, integrations.	Not part of current project.

16. Final Guardrail

For now, the product should not become bigger. It should become clearer, safer, more reliable, easier to support, easier to explain, easier to test, and easier to trust.

Final Rule

TTS Reports V1.x is a reporting aid, not a reporting platform. Anything involving accounts, storage, automation, billing, or broader business workflow belongs to V2.0 or later.
