

TTS REPORTS

Known Limitations Document

Customer-facing guidance for TTS Reports V1.0 Stable

Purpose

This document explains what TTS Reports V1.0 can and cannot do, so customers know when the app is suitable, when it may not work, and what they must check before issuing a report.

Document type: Customer-facing limitation notice

Version: V1.0 Stable

Prepared for: Test and Tag Supplies customers and support users

Recommended use: Link from the app footer, help page, and support emails

1. Plain English Summary

TTS Reports V1.0 is a reporting aid designed to help eligible customers create cleaner PDF reports from supported exported test data. It is intended to make report generation easier, but it does not replace the user's responsibility to review test data, confirm results, and issue reports correctly.

Important: A clean-looking report can still be wrong if the source file is incomplete, unsupported, incorrectly exported, or interpreted incorrectly. Always review the Asset Register and PDF output before sending a report to a customer.

2. Known Limitations at a Glance

Area	Limitation
File formats	Not all file formats are supported. Unsupported or unusual exports may fail or import incomplete data.
Report review	Reports must be reviewed by the user before they are issued to a customer.
Mobile phones	Mobile phone use may be limited because of screen size, browser downloads, and file handling.
Data storage	TTS Reports V1.0 is not designed to permanently store uploaded files or generated reports.
Customer database	The app does not maintain a customer database or permanent client records.
Cloud project history	The app does not provide cloud project history or saved report history.
Metrel status	TTS Reports is not official Metrel software and is not represented as a Metrel product.
Compliance status	TTS Reports is not a compliance certification engine and does not independently verify test results.

3. Supported and Unsupported File Expectations

TTS Reports V1.0 is designed around the supported export workflows tested during development. Customers should only expect reliable results from supported file types and supported export structures.

- **Supported file types may still vary:** A file extension alone does not guarantee compatibility. Some exports may use different structures, missing fields, or different data formatting.
- **Unsupported exports may fail:** If a file was produced by an unsupported tester, unsupported software version, modified export, or non-standard report layout, the app may fail to import it or may import only partial information.

- **PDF imports may be limited:** PDF files are not always structured data files. They may require text extraction from a report layout, which can be less reliable than structured data imports.
- **Source data quality matters:** TTS Reports can only work with the data supplied in the uploaded file. If the export is incomplete or incorrect, the generated report may also be incomplete or incorrect.

4. What TTS Reports V1.0 Does Not Do

- It does not independently test appliances or verify physical test results.
- It does not certify that a workplace, asset register, or test process is compliant.
- It does not replace technician judgement or the user's compliance obligations.
- It does not guarantee that every supported-looking file will import perfectly.
- It does not permanently store customer data, projects, uploaded files, or report history.
- It does not provide a customer database, technician database, job management system, invoicing system, CRM, or full business-management platform.
- It does not represent itself as official Metrel software.

5. Customer Review Responsibilities

Before issuing any report generated by TTS Reports, customers should complete the following checks:

- Confirm the imported asset count matches the original source file.
- Confirm pass, fail, and other result counts match the source data.
- Confirm all failed items appear correctly and are not hidden or omitted.
- Confirm retest dates and test dates are correct.
- Confirm customer, site, technician, and business details are correct.
- Confirm duplicate or repeated tests have been handled as expected.
- Preview the PDF before downloading or sending it.
- Open the downloaded PDF and confirm it matches the preview.
- Keep a copy of the original source file and the final issued report for your own records.

6. Recommended Customer-Facing Notice

Suggested wording for the app, help page, or report screen

TTS Reports is a reporting aid that generates reports from customer-supplied exported data. It does not independently verify the accuracy, completeness, legality, or compliance status of the uploaded data. You must review the imported Asset Register and the generated PDF before issuing the report to a customer. TTS Reports is not official Metrel software and is not a compliance certification engine.

7. Data Storage and Privacy Expectations

TTS Reports V1.0 is not designed as a permanent storage system. Customers should not treat it as a record archive or cloud database.

Item	Expectation
Uploaded files	Used for processing the requested import/report workflow. They should not be relied upon as stored records.
Generated reports	Customers should download and save their own final PDF reports.
Project history	No permanent cloud project history is provided in V1.0.
Customer database	No permanent customer database is provided in V1.0.
User responsibility	Customers are responsible for keeping their own source files, final reports, and compliance records.

8. Browser, Tablet and Mobile Limitations

TTS Reports is intended mainly for desktop, laptop, and tablet workflows. Mobile phone access may work for some tasks, but it is not the primary supported workflow.

Device / Browser	Support expectation
Desktop/laptop	Recommended for full report review, PDF preview, and downloading reports.
Tablet	Suitable for many workflows, especially where files are exported from a tablet-based aPAT workflow.
Mobile phone	May be limited due to small screen size, file picker behaviour, download handling, and report preview size.
Older browsers	May not support the interface, upload/download workflow, or preview behaviour reliably.

9. When to Contact Support

Customers should contact support if they see a possible report accuracy issue, especially if the issue involves pass/fail status, missing failed items, missing assets, incorrect dates, or incorrect customer/site details.

- A supported file fails to import.
- The imported asset count does not match the source file.
- Failed items do not appear correctly.
- Pass/fail counts do not match the source data.
- Retest dates appear incorrect.
- The PDF preview does not match the downloaded PDF.

- The report is missing customer, site, or business details that are present in the source file.

10. Information to Provide with a Support Request

To help investigate issues, customers may be asked to provide:

- The file type they attempted to upload.
- The source software used to export the file, such as aPAT or ES Manager.
- A screenshot of the issue or error message.
- The generated PDF, if one was produced.
- The original exported file, if they are comfortable sharing it for troubleshooting.
- A description of what they expected to appear in the report.

11. Final Customer Summary

TTS Reports V1.0 helps generate cleaner reports from supported exported data. It is not a permanent storage system, official Metrel software, or compliance certification engine. Always check the imported data and generated PDF before sending a report to a customer.

12. Recommended Placement

This limitation notice should be available from:

- TTS Reports app footer.
- Help / documentation page.
- Before report generation or preview.
- Customer Quick Start Guide.
- Support email templates.
- Terms of Use or disclaimer page.
