

TTS Reports V1.0

Internal Support Guide

Staff-facing guide for consistent customer support, escalation, issue recording and safe communication.

Purpose

Make TTS Reports supportable by the business, not just by the developer. This guide gives staff a consistent way to explain the app, support customers, collect sample files, escalate bugs and avoid over-promising.

Document Control	Details
Product	TTS Reports
Build referenced	TTS_REPORTS_v1_0_STABLE_BUILD_VERSION_LABEL
Audience	Internal Test and Tag Supplies staff
Status	Support guide for V1.0 Stable / pilot and controlled customer release
Prepared	June 2026

One-page support position

TTS Reports V1.0 is a customer-support reporting aid that helps eligible users import supported exported test data, review the Asset Register, preview reports and download cleaner PDF reports.

It is not official Metrel software, not a compliance certification engine, not a replacement for technician review, and not a permanent storage system.

Core staff message

TTS Reports helps customers generate cleaner reports from supported exported files. Customers must always review the imported data and final PDF before issuing it to their own customer.

Staff quick rules

- Confirm the customer is eligible before providing access.
- Confirm the file type and source software before troubleshooting.
- Ask the customer to check the Asset Register before generating a report.
- Treat any incorrect pass/fail, missing asset or incorrect retest date as a critical issue.
- Do not promise compatibility with every file or every tester brand.
- Do not promise that the app certifies compliance.
- Do not ask customers to send confidential third-party data unless it is needed for troubleshooting and they agree to provide it.

1. What TTS Reports is

TTS Reports is a web-based reporting tool developed as a Test and Tag Supplies support utility for eligible customers. It is designed to reduce frustration when generating PDF reports from exported test data.

TTS Reports is	TTS Reports is not
A reporting aid for supported exported files	A full replacement for Metrel software
A way to review imported asset/test data	A certified compliance authority
A PDF report generation tool	A guarantee that source data is correct
A support and brand-value tool	A permanent customer database or cloud storage system
A V1.0 Stable MVP/pilot product	A full SaaS platform with accounts, billing or report history

Plain-language explanation for staff

Suggested wording

TTS Reports is a Test and Tag Supplies tool that helps eligible customers turn supported exported test data into cleaner PDF reports. It gives customers a simpler workflow, but they still need to check the imported data and final report before sending it on.

2. Who can access it

Access should be controlled during V1.0. Staff should not treat the app as a public, unrestricted product.

Access group	Access position	Notes
Internal staff	Allowed	For testing, demonstration and customer support.
Selected pilot customers	Allowed	Prioritise trusted customers willing to provide feedback.
Existing eligible TTS customers	Controlled access	Suitable for customers using supported workflows and file types.
Non-customers	Generally no access	Refer to management before providing access.
Competitors/resellers	No access unless approved	Protect IP, positioning and supplier relationships.
Unsupported tester/software users	No support guarantee	Explain that V1.0 only supports defined file types/workflows.

Eligibility script

At this stage TTS Reports is being provided to eligible Test and Tag Supplies customers using supported exported files. I can help check whether your file type and workflow are currently supported.

3. Supported file types

Support staff should identify both the file extension and the source workflow. A supported extension does not always guarantee that every exported structure will parse correctly.

File type	Typical source	Support position for V1.0	Staff note
.pdfx	Metrel aPAT / ES Manager workflow	Supported where structure matches tested files	Ask whether exported from aPAT or ES Manager.
.apx	aPAT / ES Manager transfer file	Supported where structure matches tested files	Escalate if asset counts differ.
.xlsx	ES Manager export	Supported where columns match expected export	Check source file has expected data columns.
.pdf	aPAT exported PDF	Supported/limited parsing	PDF imports may depend on text structure and should be checked carefully.
.csv	Legacy/detailed results export if	Optional/legacy support	Only support if included in

	retained		current deployed build.
--	----------	--	-------------------------

Important support note

Never tell a customer that every file from every version of a third-party application will work. Say: supported exported files are expected to work, but files should be checked against the Asset Register and report preview.

4. Standard support workflow

Use the same troubleshooting path each time. This avoids jumping directly into fixes before confirming the basics.

1. Confirm the customer is eligible to use TTS Reports.
2. Confirm the source software and file type.
3. Ask whether the file imports successfully.
4. Ask whether the Asset Register displays the expected number of assets.
5. Ask whether pass/fail counts match the original source data.
6. Ask which report type they are generating: Basic, Pro or Upcoming Retest.
7. Ask whether the preview looks correct before download.
8. Ask whether the downloaded PDF matches the preview.
9. If there is any data accuracy issue, record it as a bug and escalate.

Initial questions to ask

Question	Why it matters
Which software did the file come from?	Different sources can produce different structures.
What is the file extension?	Confirms whether the file is in current support scope.
Does the file import or does it fail?	Separates parser/import problems from report rendering problems.
How many assets should be in the file?	Allows comparison with the Asset Register.
Are there failed tests in the source file?	Helps detect dangerous missing failed-item issues.
Which report are you trying to create?	Basic, Pro and Upcoming Retest have different checks.
Does the preview match the PDF download?	Identifies preview/export mismatch.

5. Common issues and staff responses

Issue	Likely cause	Staff response
File will not upload	Unsupported file, browser restriction, file too large, hosting issue	Check file type and browser. Ask for screenshot/error message. Escalate if supported file fails repeatedly.
File uploads but no data appears	Parser did not recognise structure	Ask for file source and version. Request sample file if customer agrees. Escalate as import bug.
Asset count looks wrong	Parser issue, duplicate handling issue, unsupported structure	Treat as high/critical. Ask customer not to issue report until reviewed. Escalate with source file.
Pass/fail count looks wrong	Data mapping or status parsing issue	Treat as critical. Stop wider use for that file type if repeated.
Failed items missing from report	Report filter/layout issue or parser issue	Treat as critical. Escalate immediately.
Retest dates look wrong	Date parsing, missing interval or incorrect calculation	Treat as critical/high depending impact. Request source file and output PDF.
Customer/site details incorrect	Source metadata mapping or user settings issue	Ask whether source file or settings contain correct details. Escalate if mapping issue.
PDF preview looks right but download differs	PDF generation/rendering issue	Escalate with screenshots and downloaded PDF.
Report formatting looks poor	Long names, pagination, narrow columns	Record as medium issue unless data is incorrect.
Mobile/tablet trouble	Browser file handling or screen limitations	Recommend desktop/laptop or supported tablet browser for critical reports.

6. How to ask customers for sample files

Sample files are often needed to diagnose import or report accuracy issues. However, staff should be careful because uploaded/exported files may contain customer names, site information, asset details and test results.

When to request a sample file

- A supported file type fails to import.
- Asset counts do not match the source file.
- Pass/fail results appear incorrect.
- Failed items are missing from the report.
- Retest dates are incorrect.
- The preview and downloaded PDF do not match.
- The same issue occurs for more than one customer.

Sample file request script

Suggested wording

To investigate this properly, we may need a copy of the exported file and the PDF generated by TTS Reports. These files may contain customer/site information, so only send them if you are authorised to share them with us for troubleshooting. We will use them only to investigate this issue and will not use them for general testing without permission.

Files to request

Request	Purpose
Original exported source file	Allows technical review of the data structure.
Generated TTS Reports PDF	Shows what the app produced.
Screenshot of Asset Register	Shows how imported data appeared before report generation.
Screenshot/error message	Helps diagnose browser or server error.
Expected asset/pass/fail count	Gives support a reference point without manually reading the whole file.

Privacy handling rule

Do not forward customer sample files casually. Store them only in the approved support location, mark the issue ID, and delete them after the support case is resolved according to the data retention policy.

7. Bug escalation process

Data accuracy bugs must be escalated quickly. A clean-looking incorrect report is the highest-risk failure mode.

Severity	Examples	Action
Critical	Wrong pass/fail, missing failed items, missing assets, incorrect retest dates that affect compliance decisions	Escalate immediately. Advise customer not to issue affected report until reviewed. Record source file, output PDF and version.
High	Key fields missing, customer/site details wrong, PDF generated but important data incomplete	Escalate same day. Add to issue register.
Medium	Formatting problem, awkward pagination, long text wrapping	Record and review for next maintenance release.
Low	Cosmetic issue, wording preference, minor UI confusion	Record as backlog item.

Bug escalation information to capture

- Customer name and business name.
- Contact details.
- Date reported.
- TTS Reports version shown in app/footer.
- Source software and file type.
- Short issue description.
- Expected result and actual result.
- Source file if customer has agreed to provide it.
- Generated PDF and screenshots where available.
- Severity level and whether customer has issued the report.

8. What not to promise

This section is critical. Support staff should be helpful without creating legal, supplier or customer expectation risk.

Do not promise	Safer wording
This is official Metrel software.	TTS Reports is a Test and Tag Supplies reporting aid for supported exported files.
It will work with every Metrel file.	It supports the defined file types/workflows tested for V1.0, but files should be reviewed after import.
The report is guaranteed compliant.	The report is generated from user-supplied data and must be checked before issue.
You do not need to check the report.	Always review the Asset Register, preview and final PDF before sending it to your customer.
We store your projects for you.	TTS Reports is designed not to permanently store customer project files or generated reports.
This will replace your existing software.	It helps with report generation but does not replace tester operation or source software requirements.
We will build that feature soon.	We will record the request for review against the development roadmap.
It will always be free.	V1.0 is currently being provided as a support tool; future pricing or access may change.
There will be no downtime.	The service is provided on a best-efforts basis during V1.0/pilot.

9. Standard support responses

Use these scripts as a base. Adjust the wording to suit the customer, but keep the meaning consistent.

What is TTS Reports?

TTS Reports is a Test and Tag Supplies reporting tool that helps eligible customers generate cleaner PDF reports from supported exported test data. It is designed to make reporting easier, but you still need to check the imported data and final report before sending it to your customer.

Can I use it on my tablet?

TTS Reports is designed mainly for desktop, laptop and tablet use. Tablet file handling can depend on the device and browser. For important reports, we recommend checking the final PDF carefully before sending it.

My file will not import.

Please confirm the file type and which software it was exported from. If it is a supported file type and still will not import, we may need the file and a screenshot of the issue so we can investigate.

The report looks wrong.

Please do not send that report to your customer yet. We need to check whether the imported data and generated PDF match the original source file. Can you confirm the asset count, pass/fail count, file type and the report type you generated?

Can you add this feature?

Thanks, that is useful feedback. We are recording feature requests for review against the TTS Reports roadmap. At this stage V1.0 is focused on stable importing, reviewing and PDF report generation.

Is my uploaded data stored?

TTS Reports is designed to process files for report generation, not to permanently store customer project files or reports. You should keep your own source files and generated reports for your records.

Is this official Metrel software?

No. TTS Reports is a Test and Tag Supplies support tool for supported exported data. It is not official Metrel software and does not replace the need to operate and check your source data correctly.

10. Internal issue register fields

All support issues should be captured in a central register rather than scattered across emails, calls or chat messages.

Field	Description
Issue ID	Unique reference number.
Date reported	Date customer raised issue.
Customer/business	Who reported it.
Contact	Email/phone for follow-up.
Source software	aPAT, ES Manager, PATLink PC or other.
File type	.padfx, .apx, .xlsx, .pdf, .csv.
Report type	Basic, Pro or Upcoming Retest.
Issue summary	Plain-English description.
Severity	Critical, High, Medium or Low.
Files received	Yes/no, plus storage location.
Status	New, investigating, fixed, deferred, closed.
Version fixed in	Release number if fixed.
Customer notified	Yes/no/date.

11. Support boundaries and escalation map

Scenario	Support action	Escalate?
Customer needs help using the app	Send Quick Start Guide and walk through import/review/generate/download.	No, unless app fails.
Unsupported file type	Explain current V1.0 supported file scope. Record request if common.	No, unless management wants to expand support.
Supported file fails to import	Record issue, request sample file, escalate as bug.	Yes.
Report data appears incorrect	Advise customer not to issue report. Record as critical/high.	Yes, immediately.
Feature request	Record in feature request register. Do not promise delivery.	Only if strategically important.
Legal/compliance question	Do not provide legal advice. Refer to terms and advise customer to verify report/data.	Yes to management if sensitive.
Supplier/Metrel relationship question	Use neutral wording. Do not criticise supplier software.	Escalate if external/supplier-facing.
Customer asks if it will remain free	State current access position only. Do not promise future pricing.	Escalate commercial questions.

12. Staff checklist before closing a support case

- Customer has been told whether the issue is resolved, under review or outside current support scope.
- Any bug has been recorded in the issue register.
- Any feature request has been recorded separately from bugs.
- Any customer files received have been stored in the approved location only.
- Critical report accuracy issues have been escalated.
- Customer has been reminded to review reports before issuing them if accuracy was discussed.
- Issue status and next action are clear.

13. Staff quick reference

Topic	Answer
Product name	TTS Reports
Current version	V1.0 Stable
Primary purpose	Generate cleaner PDF reports from supported exported test data.
Primary users	Eligible Test and Tag Supplies customers.
Main reports	Basic Report, Pro Report, Upcoming Retest Report.
Main risk	Clean-looking report with incorrect or missing data.
Critical bugs	Wrong pass/fail, missing assets, missing failed items, incorrect retest dates.
Staff reminder	Do not promise compliance certification, universal compatibility or permanent storage.

Final support principle

Be helpful, but keep the boundary clear: TTS Reports helps generate reports from imported data. The customer remains responsible for checking the data and final report before sending it to their customer.
