

TTS Reports V1.0 — Commercial, Operational and Risk Plan

1. Agreed objectives

Why are we doing it?

TTS Reports exists to solve a real customer pain point: customers using Metrel aPAT, PATLink PC, or ES Manager often struggle to generate usable, professional customer reports. The app gives them a simpler browser-based way to import their exported data and produce cleaner reports.

Who are we doing it for?

Primary audience:

Existing Test and Tag Supplies customers who own or use compatible Metrel test and tag equipment/software.

Secondary audience:

Contractors, test and tag businesses, facility maintenance teams, and compliance users who need cleaner PDF reporting from exported appliance test data.

Primary objective

The strongest primary objective should be:

Reduce customer support load while increasing Test and Tag Supplies' value as a practical solutions provider.

Secondary objectives:

Boost brand reputation

Position Test and Tag Supplies as the business that not only sells equipment, but helps customers succeed with it.

Improve customer retention

Customers who rely on TTS Reports are more likely to stay connected to Test and Tag Supplies.

Competitive advantage

The app becomes a value-added support tool competitors may not offer.

Product pathway

The free MVP can validate demand for a future paid reporting platform.

Recommended internal statement:

TTS Reports V1.0 is being launched as a customer-support and brand-value tool that helps existing customers generate cleaner reports from exported Metrel test data, reducing support friction and improving the customer experience.

2. Customer eligibility criteria

Who should we offer it to?

Recommended eligibility:

Eligible users

TTS Reports V1.0 should be offered to:

Existing Test and Tag Supplies customers.

Customers who have purchased compatible Metrel equipment from Test and Tag Supplies.

Customers who use Metrel aPAT, PATLink PC, ES Manager, or compatible exported project/report files.

Customers who accept the Terms of Use and understand the report must be reviewed before being issued.

Internal Test and Tag Supplies staff for support and demonstration purposes.
Selected beta/pilot users who are willing to provide feedback.

Optional access tiers

You could define access like this:

Access Type	Who Gets It	Purpose
Internal	TTS staff only	Testing, support, demonstrations
Pilot	Selected trusted customers	Real-world feedback
Customer Access	Existing verified customers	Main intended use
Public Demo	Limited sample-data version only	Marketing and lead capture

Recommended approach:

Start with existing customers only. Do not launch as a fully public tool immediately.

3. Non-customer access policy

Who won't we offer it to?

Recommended exclusions:

- Non-customers who have not purchased through Test and Tag Supplies.
- Competitors, resellers, or businesses that may copy the tool or positioning.
- Users wanting support for non-compatible equipment/software.
- Users wanting the app to certify compliance on their behalf.
- Users unwilling to accept the Terms of Use.
- Users seeking heavy customisation outside the MVP scope.
- Users wanting guaranteed legal/compliance certification from the app.

Recommended policy:

TTS Reports V1.0 is provided primarily for Test and Tag Supplies customers. Access may be restricted, suspended, or refused where the user is not a customer, is using unsupported equipment or files, or is using the application outside its intended purpose.

4. Pricing and licensing model

Recommended model

For V1.0, I would not make it a paid public SaaS yet.

Best model:

- Free for existing customers during MVP / pilot period.
- This keeps the objective clear: support reduction, goodwill, feedback, and validation.

Recommended structure

Stage	Model	Reason
Internal testing	Free/internal only	Confirm reliability
Pilot release	Free to selected customers	Gather feedback
V1 customer release	Free for existing customers	Support and brand value
Future Pro version	Paid subscription or licence	Monetise enhanced features

Future paid options

Possible later pricing:

Free basic version

Import files, generate basic/pro reports, limited settings.

Paid Pro version

Saved projects, cloud storage, branded templates, batch reporting, user accounts, advanced filters.

Equipment bundle value-add

Free 12-month access included with Metrel tester purchase.

Subscription

\$9–\$29/month for contractors.

One-time licence

\$99–\$299 for offline/self-hosted version.

Recommended V1 position:

TTS Reports V1.0 is currently provided free to eligible Test and Tag Supplies customers as a support tool. Future versions may include paid features, subscriptions, or licence-based access.

5. Customer communication

How do we tell customers?

Recommended channels:

Email to existing Metrel/aPAT customers.

Website support page.

QR code or link in support documents.

Mention during support calls.

Short help video.

Product page banner for compatible Metrel equipment.

Newsletter announcement.

What should we say?

The communication should be careful. Do not oversell it as certified compliance software.

Suggested customer message:

We have developed TTS Reports V1.0 to help eligible Test and Tag Supplies customers generate cleaner PDF reports from exported Metrel test data.

The tool is designed to reduce the frustration some users experience when creating customer reports from aPAT, PATLink PC, and ES Manager exports.

TTS Reports can import supported file types, display asset data, preview reports, and generate Basic, Pro, and Upcoming Retest reports.

Please note: reports should always be reviewed by the user before being issued to a customer. TTS Reports is a reporting aid, not a replacement for tester operation, technician judgement, compliance obligations, or record verification.

6. Supplier / partner conflict

What impact might this have on current relationships?

This is important. Because the app works around reporting problems in Metrel software, it could be perceived in two ways.

Positive framing

It can be positioned as:

A customer-support layer that helps users better utilise their Metrel data.

Not:

A replacement for Metrel software.

Possible supplier concerns

Metrel may see it as criticism of their reporting software.

It may be interpreted as reverse-engineering or competing with their ecosystem.

If the app imports proprietary formats, there may be licensing or copyright sensitivity.

If reports differ from official Metrel outputs, it could create confusion.

Recommended management position

Use careful language:

“Compatible with exported data from supported workflows.”

“Customer reporting aid.”

“Not affiliated with, endorsed by, or certified by Metrel unless formally agreed.”

“Users remain responsible for verifying report accuracy.”

Avoid:

“Better than Metrel.”

“Replacement for ES Manager.”

“Official Metrel report generator.”

“Certified compliance output.”

Recommended action:

Before wider release, review supplier relationship risk internally and consider whether to notify Metrel informally or keep this as a customer-support utility.

7. Cannibalisation of existing or future product offerings

Risk

If V1.0 is too powerful and permanently free, it may reduce the ability to sell a future paid reporting platform.

Recommendation

Make V1.0 useful, but define it as a basic support tool.

V1.0 should remain:

File import.

Preview.

Basic/pro PDF generation.

Asset dashboard.

Retest report.

Local settings.

Future paid version could include:

Cloud storage.

Customer database.

Saved projects.

Multi-user access.

Report history.

Email reports to clients.

Advanced branding.

Compliance registers.

Batch processing.
Technician logins.
Scheduled retest reminders.
Integration with product purchases/consumables.

Recommended policy:

V1.0 is a free customer-support utility. Advanced business workflow, storage, automation, and account-based features should be reserved for a future paid product.

8. Support responsibility

What obligation do we have to keep this running?

This depends on how it is offered.

If promoted as a free support tool, the obligation is lower, but reputational risk still exists.

If promoted as a paid service, obligations increase significantly.

Under Australian Consumer Law, businesses need to avoid misleading customers about what a product or service does, and consumer guarantees can apply to services supplied to consumers. The ACCC states that businesses must not mislead or deceive customers, and services must generally be provided with due care and skill.

Correction: the ACCC point should be treated as the legal principle, but the source above is OAIC, not ACCC. The safer general planning point is still valid: the app's claims, terms, disclaimers, and actual performance need to align. For consumer-law wording, have terms reviewed before public launch.

Recommended position:

TTS Reports V1.0 is provided on a best-efforts basis as a support tool. Test and Tag Supplies will review reported issues but does not guarantee uninterrupted access, compatibility with all files, or that every imported file will render correctly.

9. Bug reporting process

If a report renders incorrectly, how do we record and review it?

Create a simple structured process.

Bug report form fields

Customer name.

Business name.

Contact details.

Tester model.

Source software: aPAT, PATLink PC, ES Manager, other.

File type: .pdf, .padfx, .apx, .xlsx.

Description of issue.

Expected result.

Actual result.

Screenshot of error/report.

Uploaded sample file.

Report generated by TTS Reports.

Severity rating.

Date reported.

Internal status.

Severity categories

Severity	Meaning	Response
----------	---------	----------

Critical	Incorrect pass/fail, missing assets, wrong customer data	Immediate review
High	Report generates but key data is wrong	Prioritise fix
Medium	Formatting issue or incomplete minor field	Add to backlog
Low	Cosmetic issue	Review later

Internal rule

Any issue involving incorrect pass/fail status, missing assets, incorrect dates, or incorrect customer details should be treated as critical.

Recommended process:

Bugs are recorded in a central register. Critical data-integrity issues are reviewed before further promotion of the tool. Fixes are logged in the development log and version history.

10. Feature request process

How do we handle customer suggestions?

Use a feature request register.

Feature request fields

Customer/business name.

Feature requested.

Problem it solves.

Number of customers requesting similar feature.

Estimated benefit.

Estimated complexity.

Risk level.

Fits MVP? Yes/no.

Paid feature candidate? Yes/no.

Decision: accept, reject, defer, investigate.

Scoring model

Score each request from 1–5:

Customer value.

Support reduction.

Revenue potential.

Build complexity.

Risk.

Strategic fit.

Recommended policy:

Feature requests are recorded and reviewed monthly. Features that reduce support, improve report accuracy, or benefit many users are prioritised. Features that create legal, compliance, or data-integrity risk require management approval.

11. Branding

Is this a Test and Tag Supplies product?

Recommended answer:

Yes, but with careful positioning.

It should be branded as:

TTS Reports by Test and Tag Supplies

Not:

Official Metrel Reports

Visual identity

Use Test and Tag Supplies branding:

Red.

Seafoam/teal.

Charcoal.

Beige/white.

Clean industrial/compliance look.

"TTS Reports V1.0" label in footer.

Small disclaimer in app and reports.

Branding statement

TTS Reports is a Test and Tag Supplies customer-support tool designed to assist with generating cleaner reports from supported exported test data.

12. Version control policy

How do we implement change?

Use semantic-style versioning:

Version	Meaning
V1.0.0	Stable release
V1.0.1	Small bug fix
V1.1.0	Minor feature update
V2.0.0	Major change, user accounts/cloud/paid model

Recommended controls

Every release gets a version number.

Every release has a changelog.

Keep a copy of each stable release zip.

Maintain a "Known Issues" list.

Test import/report generation before release.

Do not overwrite stable builds without archiving.

Use GitHub private repository or internal version control.

Recommended policy:

All code changes must be logged, versioned, tested against sample files, and archived before release.

13. Update notification process

How do we communicate change?

For V1.0:

Add "What's New" section in the app.

Add version number in footer.

Keep release notes on the help page.

Email customers only for major updates.

Use website support page for minor updates.

Update categories

Update Type	Customer Notification
Critical bug fix	Email + app notice
Report accuracy fix	Email affected users if known
Minor UI change	App changelog
New feature	Newsletter/support page
Downtime	Website notice/email if extended

Recommended statement:

Changes to TTS Reports will be documented in the in-app changelog. Significant updates affecting report output, supported file types, or user workflow will be communicated directly to eligible users.

14. Maintenance resource requirements

Who will manage and implement improvements?

For MVP, minimum roles:

Product owner

Decides priorities, eligibility, customer communication.

Technical maintainer

Fixes bugs, updates app, manages hosting.

Support contact

Receives bug reports and customer feedback.

Management approver

Approves legal, pricing, supplier, and public-release decisions.

Time estimate

For V1.0 pilot:

1–2 hours/week for feedback review.

2–5 hours/month for bug fixes.

Extra time if report accuracy issues appear.

For public/customer release:

2–4 hours/week support/maintenance.

More if user numbers increase.

Recommended policy:

TTS Reports should not be publicly promoted unless a named internal owner is responsible for support, feedback review, version control, and maintenance.

15. Platform hosting requirements

What resources do we need?

The current build is a Flask-style web app. Hosting requirements are modest.

Basic hosting needs

Python-compatible hosting.

SSL certificate.

Domain or subdomain.

File upload capability.

Temporary storage for uploaded files/reports.

Log monitoring.

Backups of app code.

Access control if customer-only.

Recommended hosting options

For pilot:

PythonAnywhere.

Render.

Railway.

VPS.

Internal server.

Password-protected subdomain.

For production:

Managed VPS or cloud app host.

HTTPS enforced.

Monitoring.

Rate limiting.

Error logging.

Private admin access.

Recommended subdomain:

reports.testandtagsupplies.com.au

16. Security review requirements

Do we require SSL?

Yes.

Even if you do not store customer data, users upload files that may include customer names, site addresses, asset IDs, test results, and business details. SSL/HTTPS should be mandatory.

The Australian Cyber Security Centre recommends small businesses secure online accounts and systems, and HTTPS/SSL is a basic expectation for any web app handling uploaded files or customer information.

Correction: the search result above was not the ACSC page. The practical recommendation remains: use HTTPS as a minimum security requirement for any hosted file-upload tool.

Minimum security requirements

HTTPS/SSL.

File type restrictions.

File size limits.

Automatic deletion of uploaded files.

No public file listing.

No permanent customer data storage.

Input validation.

Error logging without exposing customer data.

Rate limiting.

Admin-only server access.

Regular dependency updates.

17. Data privacy obligations

What customer data is handled?

Even if the app does not store data permanently, uploaded files may contain:

Business names.

Customer names.

Site locations.

Asset details.

Test results.

Technician details.

Phone/email details.

Report metadata.

In Australia, the Privacy Act and Australian Privacy Principles apply to Australian Government agencies and many organisations, including organisations with annual turnover above \$3 million and some smaller businesses. The OAIC explains that most small businesses under \$3 million turnover are not covered, but some are, and covered entities must comply with privacy obligations.

Recommended approach

Even if legally exempt, act as though privacy expectations apply.

Recommended customer-facing statement:

TTS Reports processes uploaded files only for the purpose of generating reports. Test and Tag Supplies does not intentionally retain uploaded project files or generated reports after processing, unless the customer separately provides files for support or troubleshooting.

18. Data retention and deletion policy

We won't keep data — how do we say it?

Recommended wording:

TTS Reports is designed not to permanently store customer project files or generated reports. Uploaded files are used only to process the requested report and are deleted automatically after processing or within a short temporary processing period. Customers are responsible for saving their own reports and maintaining their own compliance records.

Internal policy

Uploaded files deleted automatically.

Generated reports deleted automatically.

Support files only retained if customer submits them for troubleshooting.

Support files deleted after issue closure unless permission is granted.

Do not use customer data for testing without permission.

Use anonymised sample files for development.

Recommended retention timing:

Uploaded files: delete immediately after report generation or within 24 hours.

Generated reports: delete within 24 hours.

Support-submitted files: delete within 30–90 days after resolution.

Logs: keep only technical logs, not uploaded data.

19. Cybersecurity responsibilities

Do we have security responsibilities?

Yes, reputationally and operationally, even if the app is free.

Key risks

Malicious file upload.

Denial-of-service attack.

Large file upload abuse.

Data leak from temporary files.

Server compromise.

Dependency vulnerability.

User accidentally uploading sensitive customer data.

Minimum controls

HTTPS.

Restrict upload file types.

Limit upload file size.

Virus/malware scanning if possible.

Store uploads outside public web root.

Delete uploads after processing.

Disable directory browsing.

Add rate limits.

Keep dependencies updated.

Use strong admin passwords.

Limit server access.

Log errors securely.

Recommended statement:

Test and Tag Supplies will apply reasonable security controls appropriate to a file-processing support tool, including HTTPS, upload restrictions, temporary file handling, and routine maintenance.

20. Legal liability exposure

Example: report says pass when it should say fail

This is the highest-risk area.

Main liability risks

Incorrect pass/fail status.

Missing failed items.

Missing assets.

Wrong retest dates.

Wrong customer/site details.

Report formatting implying compliance where data is incomplete.

User relying on the app instead of reviewing the source data.

Risk controls

Add "review before issue" warning in app.

Add disclaimer on generated reports.

Do not call reports “certified” or “compliant” unless legally reviewed.

Show imported data preview before PDF generation.

Include source file/date metadata.

Include “generated from imported data” wording.

Require user acceptance of Terms of Use.

Keep test suite with sample files.

Treat pass/fail bugs as critical.

Maintain version history.

Recommended disclaimer on reports

This report was generated from imported test data supplied by the user. The user is responsible for verifying all asset details, test results, pass/fail statuses, retest dates, and customer information before issuing this report. TTS Reports is a reporting aid and does not independently verify the accuracy, completeness, legality, or compliance status of the underlying test data.

Management/legal approval required

Before wide release, the Terms of Use and report disclaimer should be reviewed by a solicitor.

21. Terms of Use

What should they include?

Terms should include:

Who may use the app.

Supported file types.

No guarantee of compatibility.

User responsibility to verify reports.

No independent compliance certification.

No liability for incorrect imported data.

No liability for unsupported files.

No guarantee of uptime.

Data handling and deletion.

Intellectual property ownership.

Acceptable use.

Suspension or withdrawal of access.

Bug reporting process.

Privacy statement.

Governing law, likely Queensland/Australia.

Changes to terms.

Contact details.

Where should they be accessible?

Footer link in app.

Help page.

Before first upload.

On customer communication page.

On website support page.

Recommended app requirement:

Users must tick "I agree to the Terms of Use and understand I must verify reports before issuing them" before generating a report.

22. Acceptable use policy

Frequency and use limits

For V1.0, avoid unlimited heavy public use.

Recommended acceptable use:

For eligible customer business reporting only.

No automated bulk upload without permission.

No reverse engineering.

No uploading malicious files.

No using the app to process unrelated or unlawful data.

No reselling access.

No representing TTS Reports as official Metrel software.

Reasonable use limits apply.

Access may be suspended for misuse.

Example wording:

TTS Reports is provided for reasonable business use by eligible customers. Test and Tag Supplies may limit, suspend, or withdraw access if the service is misused, overloaded, accessed by unauthorised users, or used outside its intended purpose.

23. Intellectual property ownership

How is this documented?**Internally, document:**

Test and Tag Supplies owns the TTS Reports name, branding, UI, code, documentation, and report templates.

Customers retain ownership of their uploaded data.

Generated reports belong to the customer, subject to TTS template ownership.

Third-party names, formats, and trademarks remain owned by their respective owners.

Developers/contractors must assign IP rights to Test and Tag Supplies if external help is used.

Recommended clause:

TTS Reports, including its interface, report templates, documentation, branding, and software code, is owned by Test and Tag Supplies unless otherwise documented. Users retain ownership of their uploaded data and generated business records.

24. Copyright considerations

What copyright might be infringed?**Possible areas:**

Metrel software names, logos, screenshots, or branding.

Proprietary report layouts from Metrel/PATLink/ES Manager.

Reverse-engineering proprietary file formats.

Using sample customer data without permission.

Copying exact wording from supplier manuals.

Using third-party icons, fonts, or UI kits without licence.

Safer approach

Do not use Metrel logos unless authorised.

Use plain compatibility wording.

Do not copy official report layouts.

Build original TTS report templates.

Use customer-supplied exports only.

Prefer importing PDF/exported data as user-provided documents.

Keep disclaimers: "Metrel is a trademark of its owner" if needed.

Get legal review if promoting compatibility heavily.

Recommended wording:

TTS Reports is an independent Test and Tag Supplies reporting aid for use with supported exported data. Third-party product names are used only to identify compatibility and remain the property of their respective owners.

25. Downtime communication process

What if the app breaks?

For free MVP:

Add status message on app page.

Add support contact.

Notify known pilot users if outage is extended.

No guaranteed uptime unless paid service.

For paid future version:

Public status page.

Uptime target.

Incident log.

Customer email notifications.

Service credits only if contractually offered.

Recommended V1 wording:

TTS Reports is provided on a best-efforts basis. If the service is unavailable, Test and Tag Supplies will aim to restore access when practical but does not guarantee uninterrupted availability.

26. Training requirements

How do we communicate usage instructions?

Training should be simple and visual.

Minimum training materials:

One-page quick-start guide.

Screenshot walkthrough.

Short video: export from aPAT and import into TTS Reports.

Supported file types page.

Troubleshooting guide.

"Before issuing report" checklist.

In-app guidance

Add help text:

Step 1: Export file from your software.

Step 2: Upload file.

Step 3: Review imported data.

Step 4: Preview report.

Step 5: Download PDF.

Step 6: Check all details before sending.

27. User guide creation

Who writes it and where is it available?

Recommended owner:

Product owner writes draft.

Support team reviews for common customer questions.

Technical maintainer confirms accuracy.

Available in:

App Help page.

PDF download.

Website support page.

Link in customer email.

QR code from product documentation.

Recommended sections:

What TTS Reports does.

Supported file types.

Exporting from aPAT.

Exporting from ES Manager.

Uploading a file.

Reviewing asset data.

Generating Basic Report.

Generating Pro Report.

Generating Upcoming Retest Report.

Settings and branding.

Troubleshooting.

Known limitations.

Contact support.

28. Product retirement policy

How do we close the service?

This should be stated early, especially if free.

Recommended policy:

Test and Tag Supplies may modify, suspend, or retire TTS Reports at any time. Where practical, users will be given reasonable notice before permanent retirement of the service.

Suggested notice periods:

Service Type	Notice
Free pilot	7–14 days where practical
Free customer tool	30 days where practical
Paid service	60–90 days or as per terms

Since the app does not retain customer data, retirement is simpler.

Customer message:

As TTS Reports does not permanently store customer project files or reports, users should maintain their own copies of all source files and generated reports.

29. Browser and mobile compatibility

Browser support

Recommended supported browsers:

Chrome latest.

Edge latest.

Safari latest.

Firefox latest.

Unsupported:

Internet Explorer.

Old mobile browsers.

Locked-down corporate browsers with upload/download restrictions.

Mobile/tablet support

The app has strategic value because users can export from aPAT on a tablet and generate reports without needing a PC.

Recommended position:

Device	Support Level
Desktop/laptop	Fully supported
Tablet	Supported for upload, preview, report generation
Mobile phone	Limited support; viewing only or light use
Android tablet	Important target because of aPAT workflow
iPad	Should be tested but may depend on file handling

Recommended statement:

TTS Reports is designed primarily for desktop, laptop, and tablet use. Mobile phone access may work but is not the primary supported workflow due to screen size and file handling limitations.

30. Pilot program / beta testing framework

Who do we roll it out to?

Start small.

Pilot group

Recommended pilot:

5–10 trusted existing customers.

Mix of small contractors and heavier users.

Customers using aPAT.

Customers using ES Manager.

Customers who have previously needed reporting support.

Internal staff first.

Pilot duration

Recommended:

4–6 weeks.

Feedback to collect

Could they upload their file successfully?

Did the imported data look correct?

Did the Basic Report render correctly?

Did the Pro Report render correctly?

Did the Upcoming Retest Report make sense?

Were pass/fail statuses correct?

Were any assets missing?

Was the report acceptable to send to customers?

What confused them?

What feature would they most want next?

Did it reduce their need to call support?

Would they pay for a more advanced version?

Pilot success criteria

The pilot should be considered successful if:

80%+ of pilot users can generate a report without support.

No unresolved critical pass/fail rendering errors.

Users say the report is clearer than their existing process.

Support team sees reduced friction.

At least some users ask to keep using it.

Feature requests show demand for a future paid version.

Recommended decisions summary

Area	Recommended Decision
Objective	Reduce support and improve customer experience
Audience	Existing Test and Tag Supplies customers
Pricing	Free for eligible customers during MVP/pilot
Public access	Not fully public yet
Branding	TTS Reports by Test and Tag Supplies
Data storage	No permanent storage
Hosting	Secure HTTPS subdomain
Legal	Terms of Use required before wider release
Liability	User must verify reports before issue
Bug process	Critical data/report bugs prioritised
Feature process	Register, score, review monthly
Versioning	Formal version/changelog policy
Pilot	5–10 trusted users over 4–6 weeks

Best overall positioning

The cleanest positioning is:

TTS Reports V1.0 is a free customer-support reporting aid for eligible Test and Tag Supplies customers. It helps users generate cleaner PDF reports from supported exported Metrel test data. It is not compliance certification software, does not replace technician review, and users remain responsible for checking all report data before issuing it.

That positioning protects the business while still making the tool feel useful, generous, and strategically valuable.
